

Designing for Humans (Part II)

Human limits and capabilities

13

ABC

1234

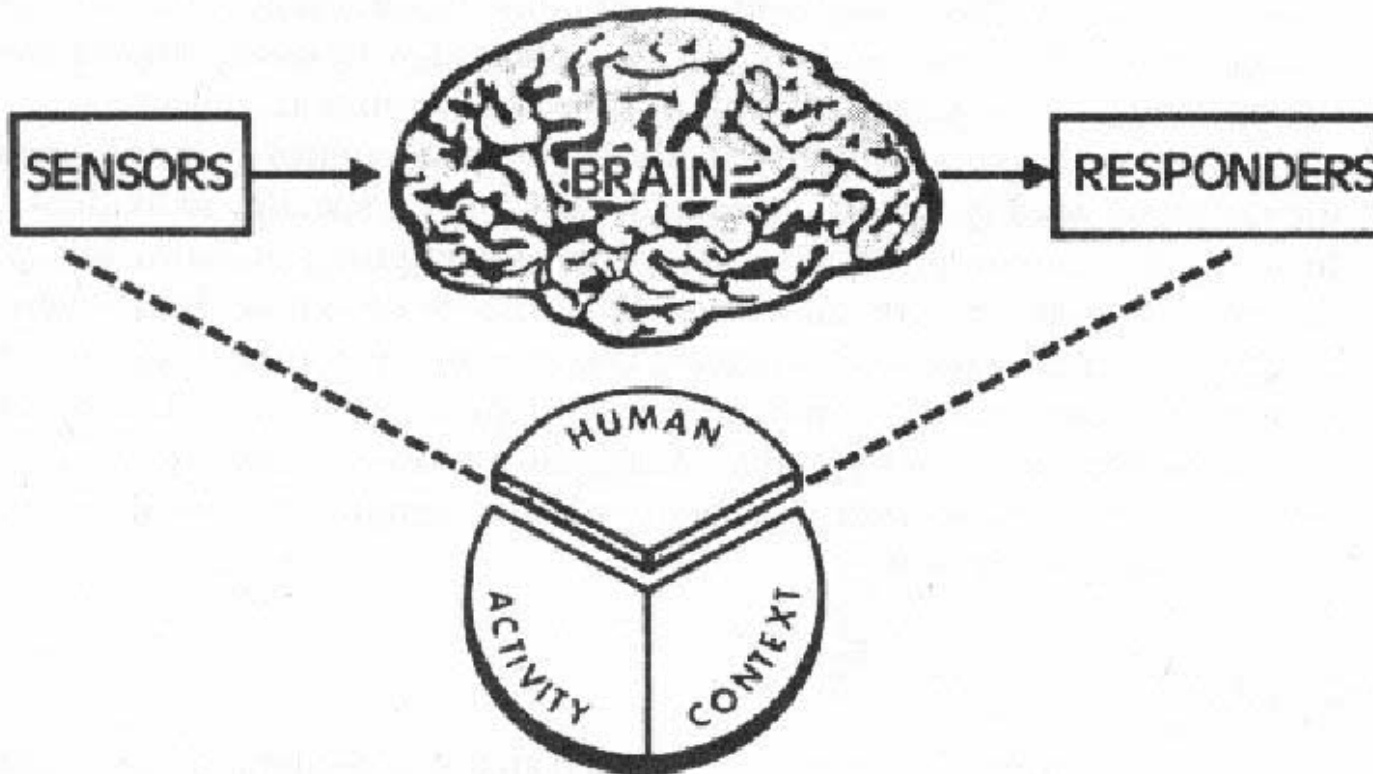

Human Performance Model

- People performing in systems have in common that they are each somebody, doing something, someplace” (Bailey, 1996)

The Human:

The most complex of the three elements

The Activity

Example: use a pointing device to

- select an icon
- write your name

The Context

Examples:

- physical context, such as noise
- social context, such as crowds or isolation

Human Performance

- Limits and differences (next slide)

Types of Limits

- Sensory limits
 - thresholds
 - deficiencies
- Responder limits
- Cognitive processing limits
 - reaction time (next slide)
 - speed
 - accuracy
 - estimating
 - multitasking

Reaction Time

- Includes sensory input and responding
- A “loop”

	Typical time delays (ms)
Sensory receptor	1-38
Neural transmission to brain	2-100
Cognitive-processing delays (brain)	70-300
Neural transmission to muscles	10-20
Muscle latency and activation time	30-70
<hr/> Total:	<hr/> 113-528

Inherent Speed Limits

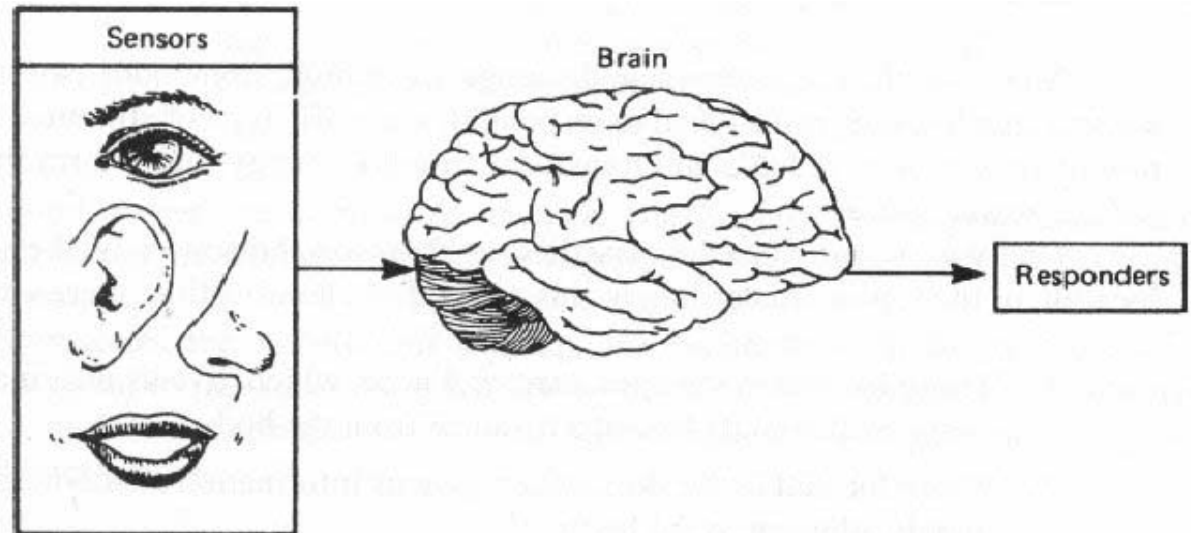

Note:
wpm = words/minute
(1 word = 5 char)

Sensory Limits

Senses:

- Sight
- Hearing
- Taste
- Smell
- Touch
- Kinesthetic
- Cutaneous
- Temperature
- Vestibular

Sensory Thresholds

<u>Sense</u>	<u>Detection Threshold</u>
Sight	Candle flame seen 30 miles on a dark clear night
Hearing	Tick of a watch under quiet conditions at 20 feet
Taste	Teaspoon of sugar in 2 gallons of water
Smell	Drop of perfume diffused into a three-room apartment
Touch	Wing of a bee falling on your neck from a distance of 1 cm

Vision Frequency Limits

Visual-Cognitive Interaction

“The Stroop Effect” (Stroop, 1935)

Say the words (or colours) in each list as quickly as possible

Record the speed and accuracy of responses

Are the results the same for each list?

BLUE
PINK
GREY
YELLOW
TAN
RED

BLUE

RED

Stroop Effect in HCI

Is there Stroop interference when entering a phone number, such as 1-800-HELLO, on a telephone keypad?

Stereogram Example (Just for fun)

Stereogram Example "shown"

Another Example

See "musical tuning.xls"

Sheppard Scale

One of the most widely used auditory illusions is Shepard's (1964) demonstration of pitch circularity, which has come to be known as the "Sheppard Scale" demonstration. The demonstration uses a cyclic set of complex tones, each composed of 10 partials separated by octave intervals. The tones are cosinusoidally filtered to produce the sound level distributions shown in Figure 1 (next slide) and the frequencies of the partials are shifted upward in steps corresponding to a musical semitone ($\sim 6\%$). The result is an "ever-increasing" scale, which is a sort of auditory analog to the ever-ascending staircase visual illusion (Figure 2, next slide).

Figure 1

Figure 2

Kinesthetic

- Probably 3rd most important, next to vision and audition
- To control our actions, we need to know the position of body parts both before and after movements
- Kinethesis provides information on the position of limbs, how far they have moved, etc.

Responder Limits

Fitts' Law

Serial task
(aka reciprocal tapping task)

Discrete task

Task Difficulty

- Fitts proposed the following "Index of
- Difficulty" for target selection tasks:

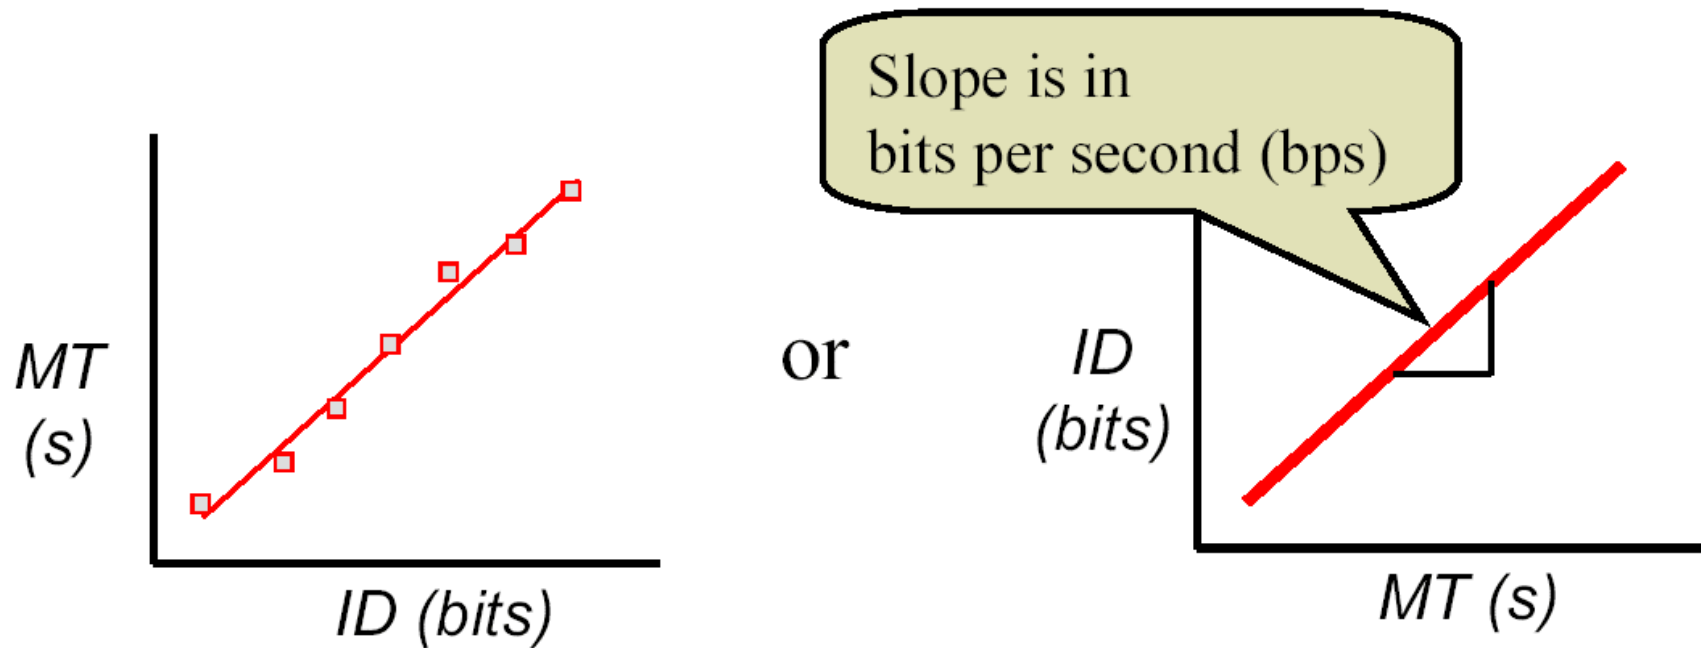

$$ID = \log_2\left(\frac{A}{W} + 1\right)$$

Unit: bits

- Where
 - A is the amplitude of movement
 - W is the width of the target

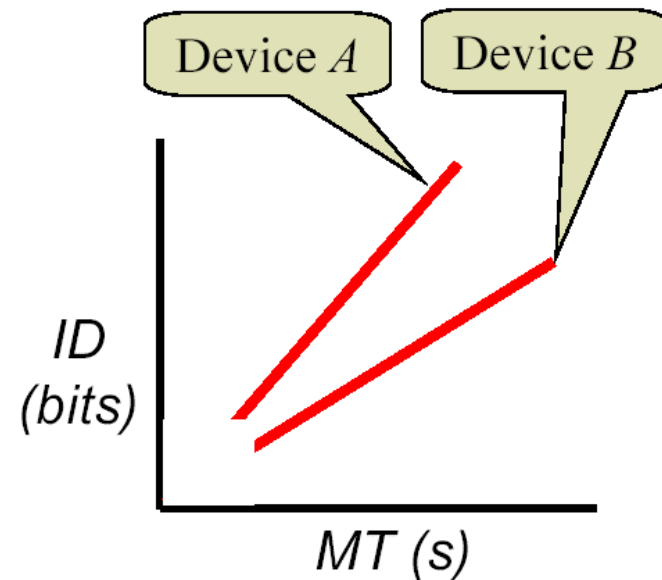

Movement Time

- proposed that the movement time (MT) to select a target is linearly related to ID :

Throughput

- Slope of the *ID-MT* relationship is a performance measure
- Depends on...
- Human
- Activity
- Context

E.g., mouse vs trackball vs ...

Throughput in HCI

- Mouse

- Trackball

- Joystick

- Touchpad

But...

Controlling for, or understanding, other effects is extremely difficult (e.g., learning, individual differences, apparatus, procedures)

Fitts' law Demo

The screenshot displays a software interface for a Fitts' law experiment. The main window, titled "FittsTaskOne", shows the text "Block 4 of 4" in red. Below the text are two vertical bars, one on the left and one on the right, with a red plus sign centered between them. Two summary windows are overlaid on the main window. The "Block summary (outliers included)" window is yellow and contains the following text: "TASK CONDITIONS: Trials = 10, A = 64, W = 16, ID = 2.32 bits; MOVEMENT BEHAVIOUR: Ae = 60.9, We = 15.22, IDe = 2.32 bits, Block repeats = 0, Errors = 0, Outliers = 0; PARTICIPANT: MT =, ER =, TP =". The "Session summary (outliers excluded)" window is light blue and contains the following text: "GRAND MEANS: MT = 658.2 ms, ER = 2.50%, TP = 5.22 bits/s; REGRESSION EQUATION: MT = -6.0 + 198.1 IDe (r = 0.9730)". An "OK" button is visible at the bottom of the session summary window.

Block summary (outliers included)

TASK CONDITIONS:
Trials = 10
A = 64
W = 16
ID = 2.32 bits

MOVEMENT BEHAVIOUR:
Ae = 60.9
We = 15.22
IDe = 2.32 bits
Block repeats = 0
Errors = 0
Outliers = 0

PARTICIPANT:
MT =
ER =
TP =

Session summary (outliers excluded)

GRAND MEANS
MT = 658.2 ms
ER = 2.50%
TP = 5.22 bits/s

REGRESSION EQUATION
MT = -6.0 + 198.1 IDe (r = 0.9730)

OK

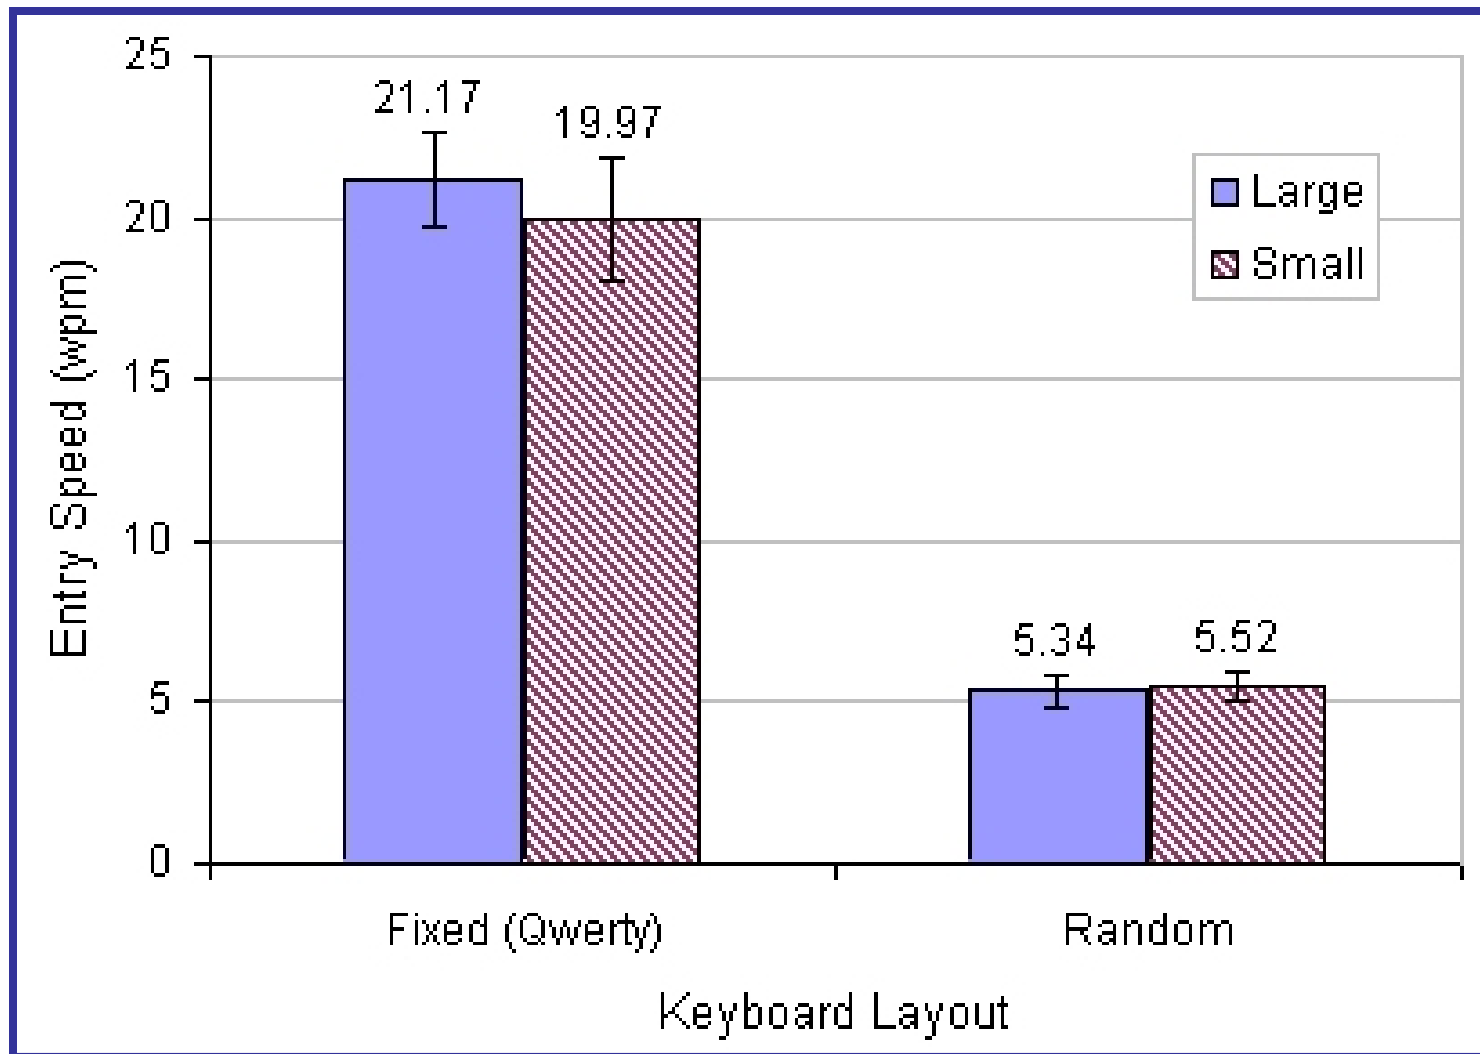

Soft Keyboard Layouts (1)

- Consider the following two layouts

- Which one is faster?

Cognitive Limits

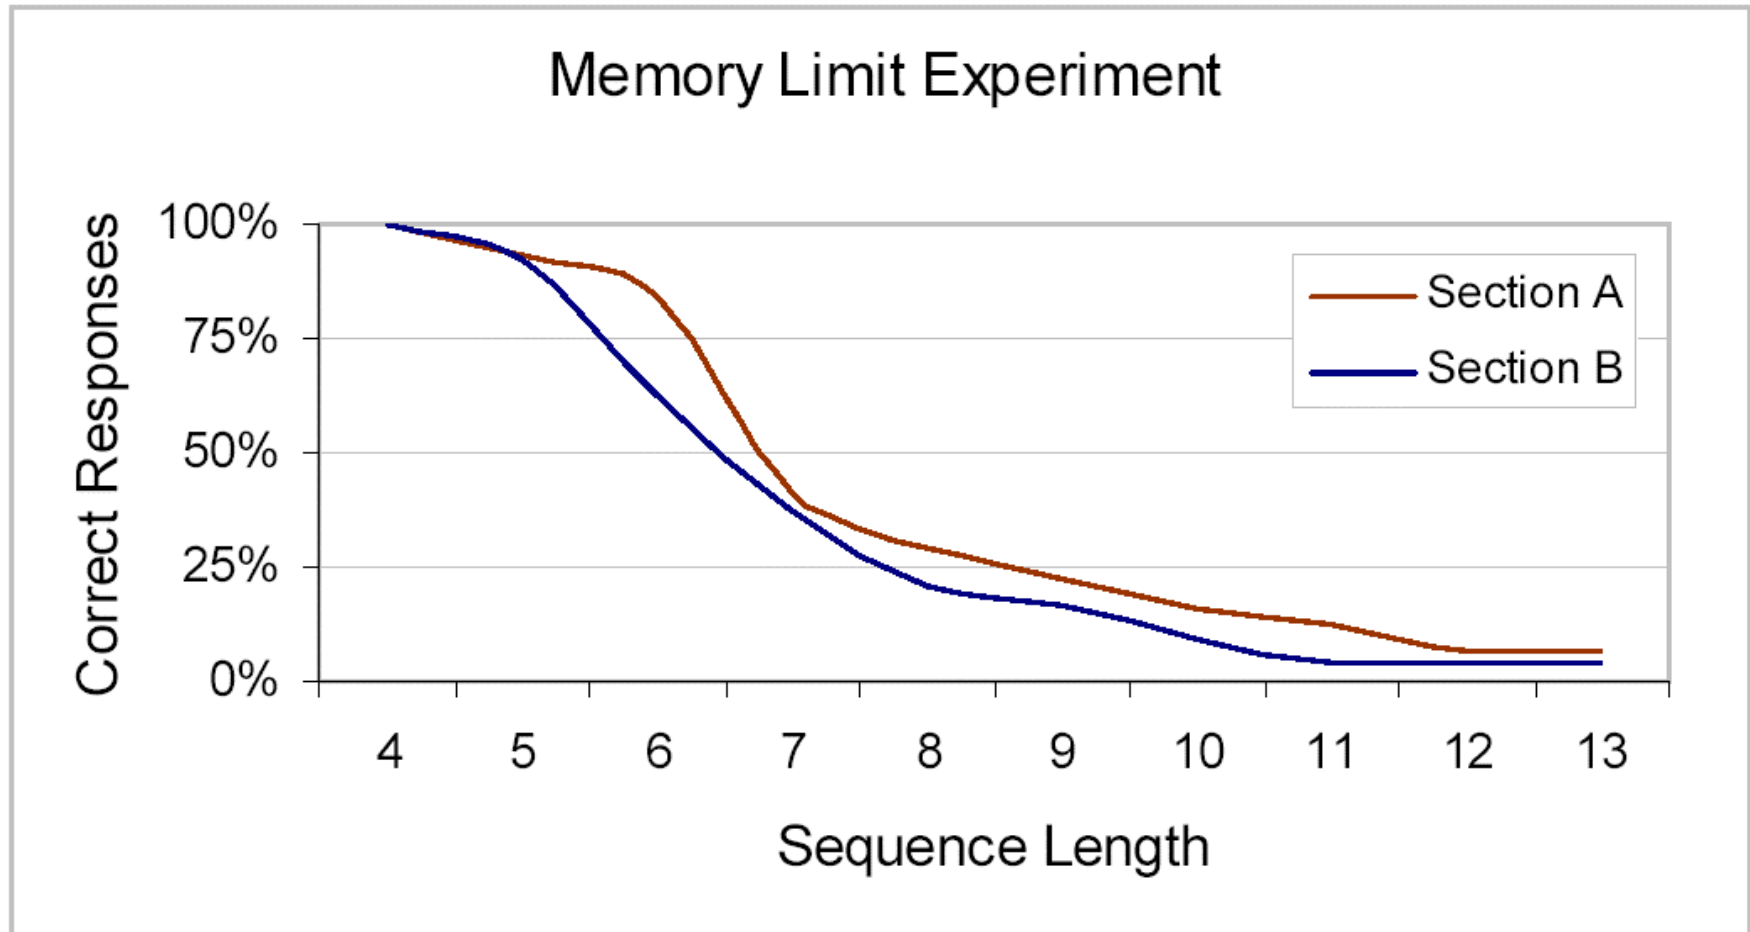

Memory Limit

- Remember Miller's "magic number 7 ± 2 "?
- Here's a quick experiment
 - I'll say a sequence of numbers
 - You write the sequence after I say it
 - We'll repeat this 10 times
 - Sequence will begin with 4 numbers and will increase to 13 numbers
 - Mark your neighbour's sheet (right/wrong)

Sequences

A 7 4 9 2
B 3 0 5 8 2
C 9 3 7 1 4 6
D 3 6 5 0 7 2 4
E 2 1 9 7 8 5 4 3
F 3 7 5 6 2 5 4 5 0
G 3 5 2 7 0 8 9 3 2 5
H 0 8 7 3 9 1 2 3 5 1 6
I 3 5 2 4 9 0 6 5 8 2 0 4
J 7 5 3 9 1 8 4 5 1 3 4 3 0
