

The Relational Model

Chapter 3

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Why Study the Relational Model?

- Most widely used model.
 - Vendors: IBM, Informix, Microsoft, Oracle, Sybase, etc.
- ❖ "Legacy systems" in older models
 - E.G., IBM's IMS
- * Recent competitor: object-oriented model
 - ObjectStore, Versant, Ontos
 - A synthesis emerging: object-relational model
 - Informix Universal Server, UniSQL, O2, Oracle, DB2

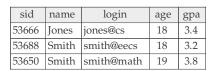

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Relational Database: Definitions

- * Relational database: a set of relations
- * Relation: made up of 2 parts:
 - Instance: a table, with rows and columns.
 #Rows = cardinality, #fields = degree / arity.
 - *Schema*: specifies name of relation, plus name and type of each column.
 - E.G. Students(sid: string, name: string, login: string, age: integer, gpa: real).
- Can think of a relation as a set of rows or tuples (i.e., all rows are distinct).

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Example Instance of Students Relation

- ❖ Cardinality = 3, degree = 5, all rows distinct
- Do all columns in a relation instance have to be distinct?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

- A major strength of the relational model: supports simple, powerful querying of data.
- Queries can be written intuitively, and the DBMS is responsible for efficient evaluation.
 - The key: precise semantics for relational queries.
 - Allows the optimizer to extensively re-order operations, and still ensure that the answer does not change.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

The SQL Query Language

- * Developed by IBM (system R) in the 1970s
- Need for a standard since it is used by many vendors
- * Standards:
 - SQL-86
 - SQL-89 (minor revision)
 - SQL-92 (major revision)
 - SQL-99 (major extensions, current standard)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

y

The SQL Query Language

❖ To find all 18 year old students, we can write:

				age	
FROM Students S	53666	Jones	jones@cs	18	3.4
WHERE S.age=18	53688	Smith	smith@ee	18	3.2

•To find just names and logins, replace the first line: SELECT S.name, S.login

Database Management Systems 3ed R Ramakrishnan and I Cohrke

Querying Multiple Relations

* What does the following query compute?

SELECT S.name, E.cid FROM Students S, Enrolled E WHERE S.sid=E.sid AND E.grade="A"

Given the following instance of Enrolled (is this possible if the DBMS ensures referential integrity?):

sid	cid	grade
53831	Carnatic101	C
53831	Reggae203	В
53650	Topology112	A
53666	History105	В

we get:

S.name	E.cid
Smith	Topology112

Database Management Systems 3ed R Ramakrishnan and I Cohrko

Creating Relations in SQL

- Creates the Students relation. Observe that the type (domain) of each field is specified, and enforced by the DBMS whenever tuples are added or modified.
- As another example, the Enrolled table holds information about courses that students take.

CREATE TABLE Students
(sid: CHAR(20),
name: CHAR(20),
login: CHAR(10),
age: INTEGER,
gpa: REAL)

CREATE TABLE Enrolled (sid: CHAR(20), cid: CHAR(20), grade: CHAR(2))

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Destroying and Altering Relations

DROP TABLE Students

 Destroys the relation Students. The schema information and the tuples are deleted.

ALTER TABLE Students
ADD COLUMN firstYear: integer

The schema of Students is altered by adding a new field; every tuple in the current instance is extended with a *null* value in the new field.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

10

Adding and Deleting Tuples

Can insert a single tuple using:

INSERT INTO Students (sid, name, login, age, gpa) VALUES (53688, 'Smith', 'smith@ee', 18, 3.2)

 Can delete all tuples satisfying some condition (e.g., name = Smith):

> DELETE FROM Students S WHERE S.name = 'Smith'

* Powerful variants of these commands are available; more later!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Integrity Constraints (ICs)

- IC: condition that must be true for any instance of the database; e.g., domain constraints.
 - ICs are specified when schema is defined.
 - ICs are checked when relations are modified.
- A legal instance of a relation is one that satisfies all specified ICs.
 - DBMS should not allow illegal instances.
- If the DBMS checks ICs, stored data is more faithful to real-world meaning.
 - · Avoids data entry errors, too!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

12

Primary Key Constraints

- * A set of fields is a key for a relation if :
 - 1. No two distinct tuples can have same values in all key fields, and
 - 2. This is not true for any subset of the key.
 - · Part 2 false? A superkey.
 - If there's >1 key for a relation, one of the keys is chosen (by DBA) to be the primary key.
- ❖ E.g., sid is a key for Students. (What about name?) The set {sid, gpa} is a superkey.

Primary and Candidate Keys in SQ

- * Possibly many candidate keys (specified using UNIQUE), one of which is chosen as the primary key.
- "For a given student and course, there is a single grade." vs. "Students can take only one course, and receive a single grade for that course; further, no two students in a course receive the same grade."
- Used carelessly, an IC can prevent the storage of database instances that arise in practice!

se Management Systems 3ed, R. Ramakrishnan and J. Gehrke

CREATE TABLE Enrolled (sid CHAR(20) cid CHAR(20), grade CHAR(2), PRIMARY KEY (sid,cid)) CREATE TABLE Enrolled

(sid CHAR(20) cid CHAR(20), grade CHAR(2), PRIMARY KEY (sid), UNIQUE (cid, grade))

Foreign Keys, Referential Integrity

- ❖ Foreign key: Set of fields in one relation that is used to 'refer' to a tuple in another relation. (Must correspond to primary key of the second relation.) Like a `logical pointer'.
- ❖ E.g. sid is a foreign key referring to Students:
 - Enrolled(sid: string, cid: string, grade: string)
 - If all foreign key constraints are enforced, referential integrity is achieved, i.e., no dangling references.
 - Can you name a data model w/o referential integrity?
 - Links in HTML!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Foreign Keys in SQL

* Only students listed in the Students relation should be allowed to enroll for courses.

> CREATE TABLE Enrolled (sid CHAR(20), cid CHAR(20), grade CHAR(2), PRIMARY KEY (sid,cid), FOREIGN KEY (sid) REFERENCES Students)

sid	cid	grade		Students				
	Carnatic101	C >	_	sid	name	login	age	gpa
	Reggae203	В -	_	53666	Jones	jones@cs	18	3.4
	Topology112	Α -		53688	Smith	smith@eecs	18	3.2
	History105	В /	~	53650	Smith	smith@math	19	3.8

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Enforcing Referential Integrity

- * Consider Students and Enrolled; sid in Enrolled is a foreign key that references Students.
- * What should be done if an Enrolled tuple with a non-existent student id is inserted? (*Reject it!*)
- What should be done if a Students tuple is deleted?
 - Also delete all Enrolled tuples that refer to it.
 - Disallow deletion of a Students tuple that is referred to.
 - Set sid in Enrolled tuples that refer to it to a *default sid*.
 - (In SQL, also: Set sid in Enrolled tuples that refer to it to a special value null, denoting `unknown' or `inapplicable'.)
- Similar if primary key of Students tuple is updated.

Database Management Systems 3ed. R. Ramakrishnan and I. Gehrke

Referential Integrity in SQL

- SQL/92 and SQL:1999 support all 4 options on deletes and updates.
 - Default is NO ACTION (delete/update is rejected)
 - · CASCADE (also delete all tuples that refer to deleted tuple)
 - SET NULL / SET DEFAULT (sets foreign key value of referencing tuple)

CREATE TABLE Enrolled (sid CHAR(20), cid CHAR(20), grade CHAR(2), PRIMARY KEY (sid,cid), FOREIGN KEY (sid) REFERENCES Students ON DELETE CASCADE ON UPDATE SET DEFAULT)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

- * ICs are based upon the semantics of the realworld enterprise that is being described in the database relations.
- * We can check a database instance to see if an IC is violated, but we can NEVER infer that an IC is true by looking at an instance.
 - An IC is a statement about all possible instances!
 - From example, we know *name* is not a key, but the assertion that sid is a key is given to us.
- * Key and foreign key ICs are the most common; more general ICs supported too.

Patabase Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Logical DB Design: ER to Relational Entity sets to tables:

CREATE TABLE Employees (ssn CHAR(11), name CHAR(20), lot INTEGER, PRIMARY KEY (ssn))

Relationship Sets to Tables

- In translating a relationship set to a relation, attributes of the relation must include:
 - Keys for each participating entity set (as foreign keys).
 - This set of attributes forms a superkey for the relation.
 - All descriptive attributes.

CREATE TABLE Works_In(ssn CHAR(1), did INTEGER, since DATE. PRIMARY KEY (ssn, did), FOREIGN KEY (ssn) REFERENCES Employees, FOREIGN KEY (did) REFERENCES Departments)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Review: Key Constraints

· Each dept has at most one manager, according to the key constraint on Manages.

Translation to relational model?

se Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Translating ER Diagrams with Key Constraints

- Map relationship to a table:
 - Note that did is the key now!
 - Separate tables for Employees and Departments.
- Since each department has a unique manager, we could instead combine Manages and Departments.

CREATE TABLE Manages(did INTEGER. since DATE, PRIMARY KEY (did),

FOREIGN KEY (ssn) REFERENCES Employees, FOREIGN KEY (did) REFERENCES Departments)

CREATE TABLE Dept_Mgr(did INTEGER, dname CHAR(20), budget REAL, ssn CHAR(11), since DATE. PRIMARY KEY (did), FOREIGN KEY (ssn) REFERENCES Employees)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Review: Participation Constraints

- Does every department have a manager?
 - If so, this is a participation constraint: the participation of Departments in Manages is said to be total (vs. partial).
 - Every did value in Departments table must appear in a row of the Manages table (with a non-null ssn value!)

Participation Constraints in SQL

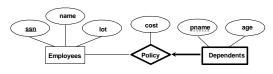

* We can capture participation constraints involving one entity set in a binary relationship, but little else (without resorting to CHECK constraints).

> CREATE TABLE Dept_Mgr(did INTEGER, dname CHAR(20), budget REAL, ssn CHAR(11) NOT NULL, since DATE, PRIMARY KEY (did), FOREIGN KEY (ssn) REFERENCES Employees, ON DELETE NO ACTION)

Patabase Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Review: Weak Entities

- * A weak entity can be identified uniquely only by considering the primary key of another (owner) entity.
 - Owner entity set and weak entity set must participate in a one-to-many relationship set (1 owner, many weak entities).
 - Weak entity set must have total participation in this identifying relationship set.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Translating Weak Entity Sets

- Weak entity set and identifying relationship set are translated into a single table.
 - · When the owner entity is deleted, all owned weak entities must also be deleted.

CREATE TABLE Dep_Policy (pname CHAR(20), age INTEGER, cost REAL, ssn CHAR(11) NOT NULL, PRIMARY KEY (pname, ssn), FOREIGN KEY (ssn) REFERENCES Employees, ON DELETE CASCADE)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Review: ISA Hierarchies Hourly_Emps Contract Emps

- * Overlap constraints: Can Joe be an Hourly_Emps as well as a Contract_Emps entity? (Allowed/disallowed)
- * Covering constraints: Does every Employees entity also have to be an Hourly_Emps or a Contract_Emps entity? (Yes/no)

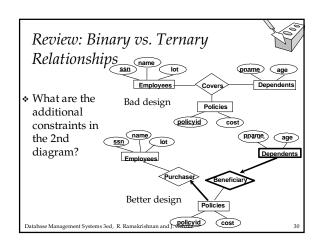

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

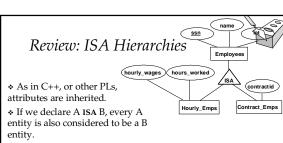

Translating ISA Hierarchies to Relations

* General approach:

- 3 relations: Employees, Hourly_Emps and Contract_Emps.
 - Hourly_Emps: Every employee is recorded in Employees. For hourly emps, extra info recorded in Hourly_Emps (hourly_wages, hours_worked, ssn); must delete Hourly_Emps tuple if referenced Employees tuple is deleted).
 - · Queries involving all employees easy, those involving just Hourly_Emps require a join to get some attributes.
- Alternative: Just Hourly_Emps and Contract_Emps.
 - Hourly_Emps: <u>ssn</u>, name, lot, hourly_wages, hours_worked.
 - Each employee must be in one of these two subclasses.

Database Management Systems 3ed. R. Ramakrishnan and I. Gehrke

Binary vs. Ternary Relationships (Contd.)

CREATE TABLE Policies (The key policyid INTEGER, constraints allow cost REAL, us to combine

ssn CHAR(11) NOT NULL, Purchaser with PRIMARY KEY (policyid). Policies and

FOREIGN KEY (ssn) REFERENCES Employees, Beneficiary with ON DELETE CASCADE) Dependents.

 Participation CREATE TABLE Dependents (constraints lead to pname CHAR(20), NOT NULL age INTEGER,

constraints. policyid INTEGER, What if Policies is PRIMARY KEY (pname, policyid).

a weak entity set? FOREIGN KEY (policyid) REFERENCES Policies,

ON DELETE CASCADE)

Views

A view is just a relation, but we store a definition, rather than a set of tuples.

> CREATE VIEW YoungActiveStudents (name, grade) AS SELECT S.name, E.grade FROM Students S, Enrolled E WHERE S.sid = E.sid and S.age<21

- Views can be dropped using the DROP VIEW command.
 - How to handle DROP TABLE if there's a view on the table?
 - DROP TABLE command has options to let the user specify

Views and Security

- Views can be used to present necessary information (or a summary), while hiding details in underlying relation(s).
 - Given YoungStudents, but not Students or Enrolled, we can find students s who have are enrolled, but not the cid's of the courses they are enrolled in.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Relational Model: Summary

- * A tabular representation of data.
- * Simple and intuitive, currently the most widely used.
- Integrity constraints can be specified by the DBA, based on application semantics. DBMS checks for violations.
 - Two important ICs: primary and foreign keys
 - In addition, we always have domain constraints.
- * Powerful and natural query languages exist.
- * Rules to translate ER to relational model

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke
