Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke 2								

# Basic SQL Query

SELECT [DISTINCT] target-list FROM relation-list WHERE qualification

- <u>relation-list</u> A list of relation names (possibly with a <u>range-variable</u> after each name).
- \* target-list A list of attributes of relations in relation-list
- **\*** *qualification* Comparisons (Attr *op* const or Attr1 *op* Attr2, where *op* is one of  $\langle , \rangle, =, \leq, \geq, \neq$ ) combined using AND, OR and NOT.
- DISTINCT is an optional keyword indicating that the answer should not contain duplicates. Default is that duplicates are <u>not</u> eliminated!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# Conceptual Evaluation Strategy

- Semantics of an SQL query defined in terms of the following conceptual evaluation strategy:
  - Compute the cross-product of *relation-list*.
  - Discard resulting tuples if they fail *qualifications*.
  - Delete attributes that are not in *target-list*.
  - If **DISTINCT** is specified, eliminate duplicate rows.
- This strategy is probably the least efficient way to compute a query! An optimizer will find more efficient strategies to compute the same answers.

Database Management Systems 3ed. R. Ramakrishnan and I. Gehrke

# Example of Conceptual Evaluation

SELECT S.sname

FROM Sailors S, Reserves R WHERE S.sid=R.sid AND R.bid=103

(sid)	sname	0	age	(sid)	bid	day
22	dustin	7	45.0	22	101	10/10/96
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	22	101	10/10/96
31	lubber	8	55.5	58	103	11/12/96
58	rusty	10	35.0	22	101	10/10/96
58	rusty	10	35.0	58	103	11/12/96

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# A Note on Range Variables

 Really needed only if the same relation appears twice in the FROM clause. The previous query can also be written as:

SELECT S.sname

FROM Sailors S, Reserves R

WHERE S.sid=R.sid AND bid=103

OR SELECT sname

FROM Sailors, Reserves WHERE Sailors.sid=Reserves.sid AND bid=103

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

It is good style, however, to use range variables always!

#### Find sailors who've reserved at least one boat

SELECT S sid FROM Sailors S. Reserves R WHERE S.sid=R.sid

- \* Would adding DISTINCT to this query make a difference?
- ❖ What is the effect of replacing *S.sid* by *S.sname* in the SELECT clause? Would adding DISTINCT to this variant of the query make a difference?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

#### Expressions and Strings

SELECT S.age, age1=S.age-5, 2\*S.age AS age2 FROM Sailors S WHERE S.sname LIKE 'B\_%B'

- Illustrates use of arithmetic expressions and string pattern matching: Find triples (of ages of sailors and two fields defined by expressions) for sailors whose names begin and end with B and contain at least three characters.
- \* AS and = are two ways to name fields in result.
- \* LIKE is used for string matching. `\_' stands for any one character and '%' stands for 0 or more arbitrary

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find sid's of sailors who've reserved a red or a green boat

UNION: Can be used to compute the union of any two union-compatible sets of tuples (which are themselves the result of SQL queries).

 If we replace OR by AND in the first version, what do we get?

 Also available: EXCEPT (What do we get if we replace UNION by EXCEPT?) SELECT S.sid

FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND (B.color='red' OR B.color='green'

SELECT S.sid

FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red'

SELECT S.sid

FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='green'

Find sid's of sailors who've reserved a red and a green boat

SELECT S.sid

\* INTERSECT: Can be used to of any two unioncompatible sets of tuples.

 Included in the SQL/92 standard, but some systems don't support it.

\* Contrast symmetry of the UNION and INTERSECT queries with how much the other versions differ.

FROM Sailors S, Boats B1, Reserves R1, Boats B2, Reserves R2 compute the intersection WHERE S.sid=R1.sid AND R1.bid=B1.bid AND S.sid=R2.sid AND R2.bid=B2.bid AND (B1.color='red' AND B2.color='green'

> Key field! SELECT S.sid FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red'

INTERSECT SELECT S.sid

FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='green'

Nested Queries

Find names of sailors who've reserved boat #103:

SELECT S.sname FROM Sailors S WHERE S.sid IN (SELECT R.sid FROM Reserves R WHERE R.bid=103)

- ❖ A very powerful feature of SQL: a WHERE clause can itself contain an SQL query! (Actually, so can FROM and HAVING clauses.)
- ❖ To find sailors who've not reserved #103, use NOT IN.
- \* To understand semantics of nested queries, think of a nested loops evaluation: For each Sailors tuple, check the qualification by computing the subquery.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# Nested Queries with Correlation

Find names of sailors who've reserved boat #103:

SELECT S.sname FROM Sailors S WHERE EXISTS (SELECT \* FROM Reserves R WHERE R.bid=103 AND S.sid=R.sid)

- \* EXISTS is another set comparison operator, like IN.
- ❖ If UNIQUE is used, and \* is replaced by *R.bid*, finds sailors with at most one reservation for boat #103. (UNIQUE checks for duplicate tuples; \* denotes all attributes. Why do we have to replace \* by *R.bid*?)
- Illustrates why, in general, subquery must be recomputed for each Sailors tuple.

# *More on Set-Comparison Operators*

- \* We've already seen IN, EXISTS and UNIQUE. Can also use NOT IN, NOT EXISTS and NOT UNIQUE.
- \* Also available: *op* ANY, *op* ALL, *op* IN >,<,=,≥,≤,≠
- ❖ Find sailors whose rating is greater than that of some sailor called Horatio:

SELECT ' FROM Sailors S WHERE S.rating > ANY (SELECT S2.rating FROM Sailors S2 WHERE S2.sname='Horatio')

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

#### Rewriting INTERSECT Queries Using IN

Find sid's of sailors who've reserved both a red and a green boat:

SELECT S.sid

FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red' AND S.sid IN (SELECT S2.sid FROM Sailors S2, Boats B2, Reserves R2

WHERE S2.sid=R2.sid AND R2.bid=B2.bid AND B2.color='green')

- \* Similarly, EXCEPT queries re-written using NOT IN.
- \* To find names (not sid's) of Sailors who've reserved both red and green boats, just replace *S.sid* by *S.sname* in SELECT clause. (What about INTERSECT query?)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

#### Division in SQL

#### Find sailors who've reserved all boats

- Let's do it the hard way, without EXCEPT:
- (2) SELECT S.sname FROM Sailors S WHERE NOT EXISTS (SELECT B.bid

FROM Boats B WHERE NOT EXISTS (SELECT R.bid

there is no boat B without ...

Sailors S such that ...

FROM Reserves R WHERE R.bid=B.bid AND R.sid=S.sid))

SELECT S.sname

FROM Sailors S

WHERE NOT EXISTS

((SELECT B.bid

EXCEPT

FROM Boats B)

(SELECT R.bid

FROM Reserves R

WHERE R.sid=S.sid))

a Reserves tuple showing S reserved B

#### *Aggregate Operators*

\* Significant extension of relational algebra.

COUNT ([DISTINCT] A) SUM ([DISTINCT] A) AVG ([DISTINCT] A) MAX (A) MIN (A)

single column

COUNT (\*)

SELECT COUNT (\*)

FROM Sailors S

SELECT S.sname FROM Sailors S

SELECT AVG (S.age) FROM Sailors S

WHERE S.rating= (SELECT MAX(S2.rating) FROM Sailors S2)

WHERE S.rating=10

SELECT COUNT (DISTINCT S.rating) SELECT AVG ( DISTINCT S.age)

FROM Sailors S FROM Sailors S WHERE S.sname='Bob' WHERE S.rating=10

#### Find name and age of the oldest sailor(s)

- The first query is illegal! (We'll look into the reason a bit later, when we discuss GROUP BY.)
- The third query is equivalent to the second query, and is allowed in the SQL/92 standard, but is not supported in some systems.

SELECT S.sname, MAX (S.age) FROM Sailors S

SELECT S.sname, S.age FROM Sailors S WHERE S.age = (SELECT MAX (S2.age) FROM Sailors S2)

SELECT S.sname, S.age FROM Sailors S WHERE (SELECT MAX (S2.age) FROM Sailors S2) = S.age

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

#### Motivation for Grouping

- \* So far, we've applied aggregate operators to all (qualifying) tuples. Sometimes, we want to apply them to each of several groups of tuples.
- \* Consider: Find the age of the youngest sailor for each rating level.
  - In general, we don't know how many rating levels exist, and what the rating values for these levels are!
  - Suppose we know that rating values go from 1 to 10; we can write 10 queries that look like this (!):

For i = 1, 2, ..., 10:

SELECT MIN (S.age) FROM Sailors S WHERE S.rating = i

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

#### Queries With GROUP BY and HAVING

SELECT [DISTINCT] target-list FROM relation-list WHERE qualification GROUP BY grouping-list group-qualification HAVING

- ❖ The *target-list* contains (i) attribute names (ii) terms with aggregate operations (e.g., MIN (S.age)).
  - The attribute list (i) must be a subset of *grouping-list*. Intuitively, each answer tuple corresponds to a group, and these attributes must have a single value per group. (A group is a set of tuples that have the same value for all attributes in *grouping-list*.)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

### Conceptual Evaluation

- ❖ The cross-product of *relation-list* is computed, tuples that fail *qualification* are discarded, `unnecessary' fields are deleted, and the remaining tuples are partitioned into groups by the value of attributes in *grouping-list*.
- \* The *group-qualification* is then applied to eliminate some groups. Expressions in group-qualification must have a single value per group!
  - In effect, an attribute in *group-qualification* that is not an argument of an aggregate op also appears in grouping-list. (SQL does not exploit primary key semantics here!)
- One answer tuple is generated per qualifying group.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find age of the youngest sailor with age  $\geq 18$ , for each rating with at least 2 <u>such</u> sailors

SELECT S.rating, MIN (S.age) FROM Sailors S WHERE S.age >= 18 GROUP BY S.rating HAVING COUNT (\*) > 1

Answer relation:

rating aga

rating	minage
3	25.5
7	35.0
8	25.5

Sailors instance:

sid	sname	rating	age
22	dustin	7	45.0
29	brutus	1	33.0
31	lubber	8	55.5
32	andy	8	25.5
58	rusty	10	35.0
64	horatio	7	35.0
71	zorba	10	16.0
74	horatio	9	35.0
85	art	3	25.5
95	bob	3	63.5
96	frodo	3	25.5

Find age of the youngest sailor with age  $\geq 18$ , for each rating with at least 2 such sailors.

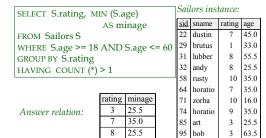

,			O					
	rating	age		rating	age			
	7	45.0		1	33.0			
	1	33.0	_	3	25.5			
	8	55.5		3	63.5		rating	minage
	8	25.5		3	25.5		3	25.5
	10	35.0		7	45.0		7	35.0
	7	35.0	,	7	35.0		8	25.5
	10	16.0		8	55.5			
	9	35.0		8	25.5			
	3	25.5		9	35.0			
	3	63.5	_	10	35.0			
	3	25.5		l		1		

Find age of the youngest sailor with age ≥18, for each rating with at least 2 such sailors and with every sailor under 60.

# HAVING COUNT (\*) > 1 AND EVERY (S.age <=60) rating age

	rating	age							
	7	45.0		1	33.0				
	1	33.0	_	3	25.5	Г			
	8	55.5		3	63.5	١.		rating	minage
	8	25.5		3	25.5			7	35.0
	10	35.0	_	7	45.0			8	25.5
	7	35.0		,					
	10	16.0	_	7	35.0	_			
	9	35.0		8	55.5		What	ic the r	esult of
	3	25.5		8	25.5	L	1		ERY to
	3	63.5		9	35.0		ANY		EKI to
	3	25.5	_	10	35.0		ANT		
Data	base Man	agement	Systems 3ed, R. Rar	hrke			23		

Find age of the youngest sailor with age  $\geq 18$ , for each rating with at least 2 sailors between 18 and 60.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# For each red boat, find the number of reservations for this boat

SELECT B.bid, COUNT (\*) AS scount FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red' GROUP BY B.bid

- \* Grouping over a join of three relations.
- What do we get if we remove B.color='red' from the WHERE clause and add a HAVING clause with this condition?
- What if we drop Sailors and the condition involving S.sid?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find age of the youngest sailor with age > 18, for each rating with at least 2 sailors (of any age)

```
SELECT S.rating, MIN (S.age)
FROM Sailors S
WHERE S.age > 18
GROUP BY S.rating
HAVING 1 < (SELECT COUNT (*)
FROM Sailors S2
WHERE S.rating=S2.rating)
```

- $\ \ \, \ \ \, \ \ \, \ \ \, \ \ \,$  Shows HAVING clause can also contain a subquery.
- \* Compare this with the query where we considered only ratings with 2 sailors over 18!
- \* What if HAVING clause is replaced by:
  - HAVING COUNT(\*) >1

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find those ratings for which the average age is the minimum over all ratings

\* Aggregate operations cannot be nested! WRONG:

SELECT S.rating FROM Sailors S

WHERE S.age = (SELECT MIN (AVG (S2.age)) FROM Sailors S2)

Correct solution (in SQL/92):

SELECT Temp.rating, Temp.avgage
FROM (SELECT S.rating, AVG (S.age) AS avgage
FROM Sailors S
GROUP BY S.rating) AS Temp
WHERE Temp.avgage = (SELECT MIN (Temp.avgage)
FROM Temp)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

#### Null Values

- Field values in a tuple are sometimes unknown (e.g., a rating has not been assigned) or inapplicable (e.g., no spouse's name).
  - SQL provides a special value <u>null</u> for such situations.
- ❖ The presence of *null* complicates many issues. E.g.:
  - Special operators needed to check if value is/is not *null*.
  - Is rating>8 true or false when rating is equal to null? What about AND, OR and NOT connectives?
  - We need a <u>3-valued logic</u> (true, false and *unknown*).
  - Meaning of constructs must be defined carefully. (e.g., WHERE clause eliminates rows that don't evaluate to true.)
  - New operators (in particular, *outer joins*) possible/needed.

    atabase Management Systems 3ed, R. Ramakrishnan and J. Gehrke

*Integrity Constraints (Review)* 

- An IC describes conditions that every legal instance of a relation must satisfy.
  - $\bullet \ \ Inserts/deletes/updates \ that \ violate \ IC's \ are \ disallowed.$
  - Can be used to ensure application semantics (e.g., sid is a key), or prevent inconsistencies (e.g., sname has to be a string, age must be < 200)</li>
- <u>Types of IC's</u>: Domain constraints, primary key constraints, foreign key constraints, general constraints.
  - Domain constraints: Field values must be of right type. Always enforced.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

General Constraints

 Useful when more general ICs than keys are involved.

 Can use queries to express constraint.

 Constraints can be named. CREATE TABLE Sailors
( sid INTEGER,
sname CHAR(10),

rating INTEGER, age REAL, PRIMARY KEY (sid), CHECK (rating >= 1

AND rating <= 10)

CREATE TABLE Reserves

( sname CHAR(10), bid INTEGER, —\_\_\_ day DATE,

PRIMARY KEY (bid,day),

CONSTRAINT noInterlakeRes
CHECK ('Interlake' <>

(SELECT B.bname FROM Boats B WHERE B.bid=bid)))

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

u-bia)))

# Constraints Over Multiple Relations

CREATE TABLE Sailors

( sid INTEGER, sname CHAR(10), rating INTEGER,

Number of boats plus number of sailors is < 100

\* Awkward and wrong! If Sailors is empty, the number of Boats

tuples can be

not associated

anything!

age REAL, PRIMARY KEY (sid), CHECK

( (SELECT COUNT (S.sid) FROM Sailors S) + (SELECT COUNT (B.bid) FROM Boats B) < 100

\* ASSERTION is the **CREATE ASSERTION** smallClub right solution;

CHECK with either table. ((SELECT COUNT (S.sid) FROM Sailors S)

+ (SELECT COUNT (B.bid) FROM Boats B) < 100

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# **Triggers**

- \* Trigger: procedure that starts automatically if specified changes occur to the DBMS
- \* Three parts:
  - Event (activates the trigger)
  - Condition (tests whether the triggers should run)
  - Action (what happens if the trigger runs)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# Triggers: Example (SQL:1999)

 $CREATE\ TRIGGER\ young Sail or Update$ AFTER INSERT ON SAILORS REFERENCING NEW TABLE NewSailors FOR EACH STATEMENT

INSERT

INTO YoungSailors(sid, name, age, rating) SELECT sid, name, age, rating FROM NewSailors N WHERE N.age <= 18

# Summary

- \* SQL was an important factor in the early acceptance of the relational model; more natural than earlier, procedural query languages.
- \* Relationally complete; in fact, significantly more expressive power than relational algebra.
- ❖ Even gueries that can be expressed in RA can often be expressed more naturally in SQL.
- \* Many alternative ways to write a query; optimizer should look for most efficient evaluation plan.
  - In practice, users need to be aware of how queries are optimized and evaluated for best results.

# Summary (Contd.)

- \* NULL for unknown field values brings many complications
- \* SQL allows specification of rich integrity constraints
- \* Triggers respond to changes in the database

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke
