1

- ▶ Last date to drop courses without receiving a grade : Nov 9<sup>th</sup>
- ▶ No Assignment is released today!
- ▶ Test 2 on Nov 5<sup>th</sup>.
  - Ch2.1–2.5
  - 7pm–8:20pm
  - Location: SLH F (Last name from A–L) and SLH A (Last name from M–Z)
  - Lecture: 8:40pm, SLH A.
- ▶ You may pick up your Assignment 4 during my office hour: Nov 5<sup>th</sup> 2:00pm – 4:00pm (TEL 3056)

2

## Mathematical Induction

- ▶ Proof methods: direct proof, proof by cases, proof by contraposition, proof by contradiction, disproof by counterexample
- ▶ Mathematical induction
  - very simple and powerful proof technique
  - often used to prove  $P(x)$  is true for all positive integers
  - “Guess” and verify strategy

3

## Principle of Mathematical Induction

$$(P(1) \wedge \forall k(P(k) \rightarrow P(k+1))) \rightarrow \forall nP(n)$$

- ▶ To prove that  $\forall nP(n)$ , where  $n \in \mathbb{Z}^+$  and  $P(n)$  is a propositional function, we complete two steps:
  - i) Basis step: Verify  $P(1)$  is true
  - ii) Inductive step: Show  $P(k) \rightarrow P(k+1)$  is true for arbitrary  $k \in \mathbb{Z}^+$

4

## Mathematical Induction

- ▶ Knowing it is true for the first element means it must be true for the next element, i.e. the second element
- ▶ Knowing it is true for the second element implies it is true for the third and so forth.

$$\begin{array}{c} P(1) \\ P(k) \rightarrow P(k+1) \\ \hline P(2) \end{array}, \begin{array}{c} P(2) \\ P(k) \rightarrow P(k+1) \\ \hline P(3) \end{array}, \dots$$

- ▶ Need a starting point (Base case)

5

- ▶ How to show  $P(1)$  is true?
  - Replace  $n$  by 1 in  $P(n)$
- ▶ How to show  $P(k) \rightarrow P(k+1)$  is true?
  - Direct proof is normally used
  - (Inductive Hypothesis) Assume  $P(k)$  is true for some arbitrary  $k$
  - Then show  $P(k+1)$  is true

6

## Proving Summation

- ▶ Example: Show that  $1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$ , where  $n \in \mathbb{Z}^+$
- ▶ Proof:
  - Basis case P(1): LHS= $1^2 = 1$ , RHS= $1 \cdot (1+1)(2 \cdot 1+1)/6 = 1$
  - Inductive step:
    - Assume P(k) is true:  $1^2 + 2^2 + 3^2 + \dots + k^2 = \frac{k(k+1)(2k+1)}{6}$
    - For P(k+1): Show that  $1^2 + 2^2 + 3^2 + \dots + k^2 + (k+1)^2 = \frac{(k+1)(k+2)(2k+3)}{6}$  (Details on Board)
    - We showed P(k+1) is true under the assumption that P(k) is true.
  - By mathematical induction P(n) is true for all positive integers

7

## Proving Inequalities

- ▶ Example:  $n < 4^n$ , where  $n \in \mathbb{Z}^+$
- ▶ Proof
  - Basis case: P(1) holds since  $1 < 4$
  - Inductive step:
    - Assume P(k) is true:  $k < 4^k$
    - For P(k+1):  $k+1 < 4^k + 1 < 4^k + 4^k = 2 \cdot 4^k < 4 \cdot 4^k = 4^{k+1}$
  - By mathematical induction P(n) is true for all positive integers

8

## Proving divisibility

- ▶ Example: Prove that  $n^3 - n$  is divisible by 3 whenever n is a positive integer.
- Basis step: P(1):  $1^3 - 1 = 0$ , which is divisible by 3.
- Inductive step:
  - Assume P(k) is true:  $k^3 - k$  is divisible by 3
  - For P(k+1):
 
$$\begin{aligned} (k+1)^3 - (k+1) &= k^3 + 3k^2 + 3k + 1 - k - 1 \\ &= (k^3 - k) + 3(k^2 + k) \end{aligned}$$
 From the assumption,  $k^3 - k$  is divisible by 3, so P(k+1) is true.
- By mathematical induction, P(n) is true for all positive integers

9

## Mathematical Induction (Base case $n \neq 1$ )

- ▶ Basis case does not have to be  $n=1$
- ▶ How to show that P(n) is true for  $n=b, b+1, b+2, \dots$  where b is an integer other than 1?
  - i) Basis step: Verify P(b) is true
  - ii) Inductive step: Show  $P(k) \rightarrow P(k+1)$  is true for arbitrary  $k \in \mathbb{Z}$

10

- ▶ Show that  $1 + 2 + 2^2 + \dots + 2^n = 2^{n+1} - 1$ , where  $n \in \mathbb{N}$

- ▶ Proof by induction:
  - Basis step: P(0): LHS=1, RHS =  $2^1 - 1 = 1$ .
  - Inductive step:
    - Assume P(k) is true for arbitrary  $k \in \mathbb{N}$ ,  $1 + 2 + \dots + 2^k = 2^{k+1} - 1$
    - Need to show P(k+1):  $1 + 2 + \dots + 2^k + 2^{k+1} = 2^{k+2} - 1$  is true.
 
$$\text{LHS} = (1 + 2 + \dots + 2^k) + 2^{k+1} = 2^{k+1} - 1 + 2^{k+1} = 2^{k+2} - 1$$
 So LHS = RHS. We showed P(k+1) is true under the assumption that P(k) is true.
  - By mathematical induction P(n) is true for all natural numbers

11

- ▶ Prove  $\sum_{i=0}^n ar^i = \frac{ar^{n+1} - a}{r-1}$  if  $r \neq 1$

- ▶ Proof by induction:
  - P(n):  $a + ar + ar^2 + \dots + ar^n = \frac{(ar^{n+1} - a)}{(r-1)}$
  - Basis case: P(0):  $a = \frac{(ar - a)}{(r-1)}$ . So, P(0) is true
  - Inductive step:
    - Assume P(k) is true for arbitrary  $k \in \mathbb{N}$ ,  $a + ar + ar^2 + \dots + ar^k = \frac{(ar^{k+1} - a)}{(r-1)}$
    - Need to show P(k+1):  $a + ar + ar^2 + \dots + ar^k + ar^{k+1} = \frac{(ar^{k+2} - a)}{(r-1)}$  is true.
 
$$\text{LHS} = \frac{(ar^{k+1} - a)}{(r-1)} + ar^{k+1} = \frac{(ar^{k+1} - a + ar^{k+2} - ar^{k+1})}{(r-1)}$$
    - So LHS = RHS.
    - We showed P(k+1) is true under the assumption that P(k) is true.
  - By mathematical induction P(n) is true for all natural numbers

12

## A wrong proof, WHY?

- ▶ Show that all horses are the same color.
- ▶ Proof:
  - We do induction on the size of sets of horses of the same color.
  - Basis step: Obviously all sets of 0 horses (and all sets with 1 horse) are the same color
  - Inductive step:
    - Assume all horses are the same color for  $k$  horses
    - Now show it must be true for all sets of  $k+1$  horses
    - Every set of  $k+1$  horses has an overlap of horses which are the same color.
    - So  $k+1$  horses have the same color.
    - Therefore all horses have the same color.

13

## Strong Induction

$$(P(1) \wedge \forall k(P(1) \wedge P(2) \wedge \dots \wedge P(k) \rightarrow P(k+1))) \rightarrow \forall n P(n)$$

- ▶ To prove that  $\forall n P(n)$ , where  $n \in \mathbb{Z}^+$  and  $P(n)$  is a propositional function, we complete two steps:
  - i) Basis step: Verify  $P(1)$  is true
  - ii) Inductive step: Show  $P(1) \wedge P(2) \wedge \dots \wedge P(k) \rightarrow P(k+1)$  is true for arbitrary  $k \in \mathbb{Z}^+$

14

## Strong Induction Variation

- ▶ A more general strong induction can handle cases where the inductive step is valid only for integers greater than a particular integer.
- ▶ To prove that  $P(n)$  is true for all integer  $n \geq b$ , we complete two steps:
  - i) Basis step: Verify  $P(b)$ ,  $P(b+1)$ , ...,  $P(b+j)$  are true
  - ii) Inductive step: Show  $P(b+1) \wedge P(b+2) \wedge \dots \wedge P(b+k) \rightarrow P(k+1)$  is true for every integer  $k \geq b+j$

15

- ▶ Example: Show that if  $n$  is an integer greater than 1, then  $n$  can be written as the product of primes

- ▶ Proof by strong induction:

- First identify  $P(n)$ ,  $P(n)$ :  $n$  can be written as the product of primes
- Basis step:  $P(2)$ : 2 is a prime number, so  $P(2)$  is true.
- Inductive step:
  - Assume  $P(j)$  is true for  $1 < j \leq k$  for an arbitrary  $k > 1$ , i.e.  $j$  can be written as the product of primes when  $1 < j \leq k$
  - Need to show  $P(k+1)$ .
    - Case 1:  $k+1$  is prime, then  $P(k+1)$  is true.
    - Case 2:  $k+1$  is composite  
 $k+1 = a \cdot b$ , where  $a$  and  $b$  are positive integers, and  $2 \leq a, b \leq k$ .  
 By the assumption,  $a$  and  $b$  can be written as the product of primes. Then  $k+1$  can be written as the product of primes.
