

```
import java.lang.System;  
public class Area  
{  
    public static void main(String[] args)  
    {  
        int width;  
        width = 8;  
        int height = 3;  
        int area = width * height;  
        System.out.println(area);  
    }  
}
```

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 14

```
import java.lang.System;  
public class Area  
{  
    public static void main(String[] args)  
    {  
        int width;  
        width = 8;  
        int height = 3;  
        int area = width * height;  
        System.out.println(area);  
    }  
}
```

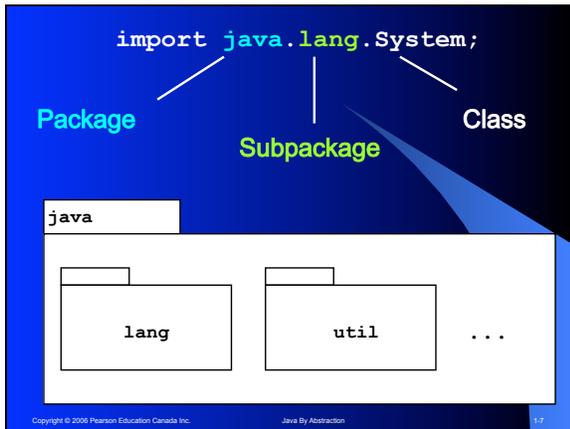

Imports

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 15

```
import java.lang.System;  
public class Area  
{  
    public static void main(String[] args)  
    {  
        int width;  
        width = 8;  
        int height = 3;  
        int area = width * height;  
        System.out.println(area);  
    }  
}
```

Imported Class = Delegation

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 16

- Note the difference:
`import java.lang.System;`
versus
`import java.lang.*;`

- And as a matter of style:
The package naming convention calls for **lowercase letters**.

```
import java.lang.System; Class Header
public class Area ←
{ ←
    public static void main(String[] args)
    {
        int width;
        width = 8;
        int height = 3; ← Class Body, a Block
        int area = width * height;
        System.out.println(area);
    }
} ←
```

```
import java.lang.*;
public class Area
{
    public static void main(String[] args)
    {
        int width;
        width = 8;
        int height = 3;
        int area = width * height;
        System.out.println(area);
    }
}
```

Method Header

Method Body, a Block

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-10

Style

- Class naming convention**
Use title case unless an acronym, e.g. Math, UTL, StringTokenizer.
- Method naming convention**
Use lowercase letters but for multi-word names, capitalize the first letter of each subsequent word, e.g. main, equals, toString, isLeapYear
- Block layout**
Braces must align vertically and the all statements must be left justified and indented by one tab position.

1.1.2 Language Elements

Still without worrying about semantics, let us identify the elements of a program:

- Keywords
- Identifiers
- Literals
- Operators
- Separators

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-12

Keywords *The reserved words are the keywords plus the literals:
true, false, null*

Identifiers *Must not be a reserved word, must begin with a letter,
and its character set must be: {0-9, A-Z, a-z, _}*

Literals *Recognized by the presence of a number, 'character',
"characters", or one of: true, false, null*

Operators *The character set of operators:
= > < ! ~ ? : & | + - * / ^ %*

Separators *The separators are:
. , ; ... () [] { }*

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-13

Keywords

abstract	assert				
boolean	break	byte			
case	catch	char	class	const	continue
default	do	double			
else	enum	extends			
final	finally	float	for		
goto					
if	implements	import	instanceof	int	interface
long					
native	new				
package	private	protected	public		
return					
short	static	strictfp	super	switch	synchronized
this	throw	throws	transient	try	
void	volatile				
while					

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-14

Example

Identify the **language elements** in the following program...

Keywords, Identifiers, Literals, Operators, Separators

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-15

```
import java.lang.System;  
public class Area  
{  
    public static void main(String[] args)  
    {  
        int width;  
        width = 8;  
        int height = 3;  
        int area = width * height;  
        System.out.println(area);  
    }  
}  
Keywords, Identifiers, Literals, Operators, Separators
```

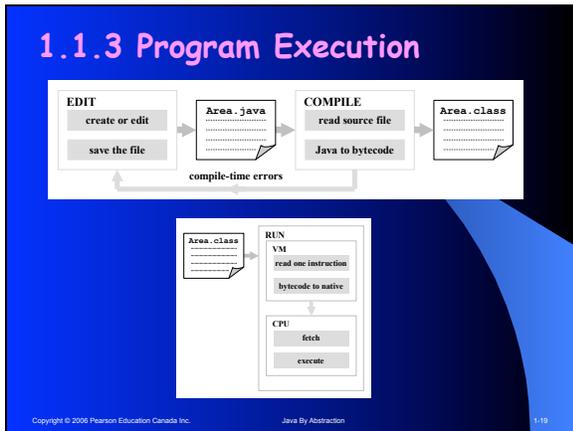

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-16

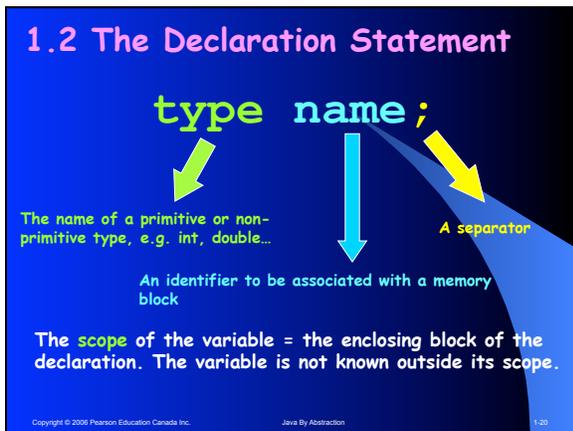

```
import java.lang.System;  
public class Area  
{  
    public static void main(String[] args)  
    {  
        int width;  
        width = 8;  
        int height = 3;  
        int area = width * height;  
        System.out.println(area);  
    }  
}  
Keywords, Identifiers, Literals, Operators, Separators
```

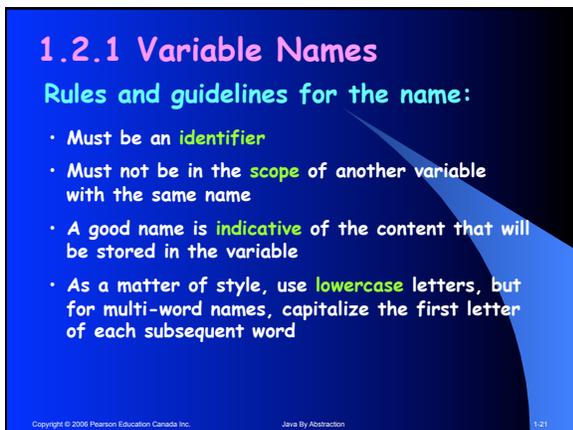

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-17

```
import java.lang.System;  
public class Area  
{  
    public static void main(String[] args)  
    {  
        int width;  
        width = 8;  
        int height = 3;  
        int area = width * height;  
        System.out.println(area);  
    }  
}  
Keywords, Identifiers, Literals, Operators, Separators
```

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-18

1.2.2 The Integer Types

A **type** is a **range** of values and a set of **operations** on these values.

The range of the **int** type consists of all whole numbers between -2 and +2 billions (approx). int supports the four **arithmetic** operations plus the **remainder**.

The **long** type is very similar to int except its range is much bigger, +/-10¹⁹

An integer **literal** has an int type unless suffixed by **L (l)**, in which case it is long.

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.22

1.2.3 Declaration and Memory

- Logical versus Physical
- Address versus Content
- Bytes, KB, MB, GB, TB, ...
- **The Memory Block**
 - 1-byte block at address 24
 - 1-byte block at address 25
 - 2-byte block at address 26
 - 4-byte block at address 28

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.23

What happens when we write:

int width;

width →

1. A block big enough to hold an **int** is allocated, e.g. a 4B block at 24
2. Its address is associated with the variable name, e.g. 24 with width

Note that no initialization is involved; only an association of a name with an address.

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.24

1.2.4 Other Data Types

- Integer ●●● Use for integer data, e.g. count. 100% exact
- Real ●●● Use for real data, e.g. amount. Inherently inaccurate

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.25

Numeric Types

- Integer
 - int 4 ±2G exact
 - long 8 ±2E exactInteger literals are int by default unless suffixed with L
- Real
 - float 4 ±10³⁸ SD=7
 - double 8 ±10³⁰⁸ SD=15Real literals are recognized thru a decimal point or an exponent. They are double by default unless suffixed with F

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.26

The Type boolean

- Stores the result on a condition
- Has only two possible values
- true and false are reserved words
- Boolean variables are not integers

Note: Boolean literals are the easiest to recognize!

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.27

The Character Type `char`

- A letter, digit, or symbol
- Digits versus Numbers
- Store the code, not the typeface
- The case of English: ASCII
- `char` is thus an (unsigned) integer type
- Unicode has 64K codes

Character **literals** are recognized by single quotes surrounding one character, e.g. 'A'

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.28

More on Characters

Code	Character
0	
:	
32	space
:	
48-57	'0' - '9'
:	
65-90	'A' - 'Z'
:	
97-122	'a' - 'z'
:	
65535	

Escape	Meaning
\uxxxx	The character whose code is (hex) xxxxx
\'	Single quote
\"	Double quote
\\	Backslash
\n	New line
\r	Carriage return
\f	Form Feed
\t	Tab
\b	Backspace

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.29

1.2.5 Primitive & Non-Primitive

```
graph LR; Root[ ] --- Primitive; Root --- NonPrimitive; Primitive --- number; Primitive --- character; Primitive --- boolean; NonPrimitive --- class; NonPrimitive --- interface; NonPrimitive --- array;
```

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.30

Examples

```
double price;  
price = 17.25;  
int quantity = 25;  
boolean isValid = false;  
double cost;  
cost = price;  
double extended;  
extended = quantity * price;
```

Can combine declaration with assignment.

RHS is a variable

RHS is an expression

1.3.2 Other Arithmetic Operators

Each of `long`, `float`, and `double` come with 11 operators with the same symbols as `int`; i.e. the symbols are **overloaded**. Note:

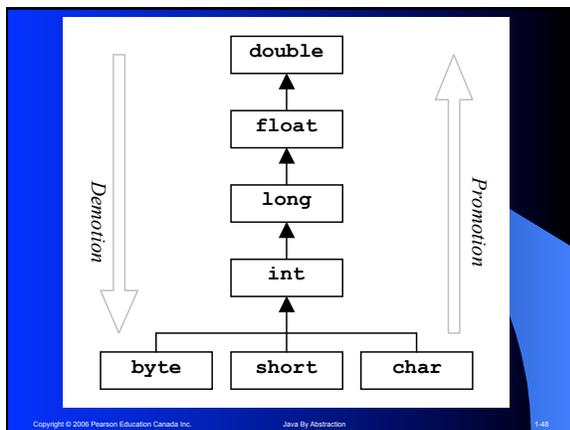

- The `int` operators satisfy **closure** thru circular wrapping
- The `/` `int` operator always **rounds** toward 0 and leads to an **exception** if the divisor is zero
- The **sign** of `%` is the same as that of the dividend
- The real operators satisfy closure by adding **Infinity** and **NaN**. Hence, dividing by zero does not lead to exceptions
- $(a * b) / c$ is not the same as $a * (b / c)$ for any type
- $(a + b) - c$ is not the same as $a + (b - c)$ for real types

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.46

1.3.3 Mixed Types and Casting

- **Promotion** (aka widening conversion) is done automatically **when** needed
- May lead to loss of precision but the order of magnitude is preserved
- **Demotion** is not done automatically. Can be done manually thru a **cast**
- Casting is risky...**avoid it**.

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.47

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1.48

Note:

- The cast operator has a precedence that is higher than * but less than ++
- The = operator has the lowest precedence of all operators
- There are shorthand operators to combine assignment with an operator:

`x op= y` is shorthand for `x = x op y`

Ex: `x +=1` is like `x = x + 1` or `x++`

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction 1-49

Example

```
int iVar = 15;  
long lVar = 2;  
float fVar = 7.6f - iVar / lVar;  
double dVar = 1L / lVar + fVar / lVar;  
int result = 100 * dVar;
```

Fix, if need be, and output result
The answer may surprise you!
