

EECS 1022 P Jan 18 Lecture

Yves Lesperance

Do This Week

- Quiz #1 on Wed at 10:30, see announcement on Moodle site.
- Lab Audio Generation: prepare, do pre-lab quiz, go to your lab section, and do report
- Read and digest lecture material

Relational Operators

< <= > >=

== !=

Numeric operands

Operands of any type

All relational operands are "odd" in that they violate closure: no matter what the operand type is, the result type is always `boolean`.

Operator Precedence

Precedence	Operator	Operands	Syntax	true if
-7 →	<	numeric	x < y	x is less than y
	<=	numeric	x <= y	x is less than or equal to y
	>	numeric	x > y	x is greater than y
	>=	numeric	x >= y	x is greater than or equal to y
	instanceof	x instanceof C is true if object reference x points at an instance of class C or a subclass of C.		
-8 →	==	any type	x == y	x is equal to y
	!=	any type	x != y	x is not equal to y

Boolean Expressions

- **Relational Expression**
`(k < 0)`
- **Boolean Variable**
`boolean b = k < 0`
- **Boolean Expression**
`(k < 0 || b && m > h)`

Uses boolean operators: &&, ||, and !

Operator Precedence

. ++ -- !
 cast
 * / %
 + -
 < <= > >=
 == !=
 &&
 ||
 = op=

Copyright © 2006 Pearson Education Canada Inc. Java By Abstraction

Examples

- Express the condition $x \in [a, b)$
- Express the condition $x \notin [a, b)$

Copyright © 2006
Pearson Education Canada Inc.
Java By Abstraction

Examples

- Express the condition $x \in [a, b)$
`(x >= a && x < b)`
- Express the condition $x \notin [a, b)$
`(!(x >= a && x < b))`

Can use deMorgan's Law to convert negated conjunctions to disjunctions.

`(x < a || x >= b)`

Operations on char data

- Can use integer operators with char data, e.g.
`char let1 = 'D';`
`char let2 = (char) (let1 + 1);`
- Here let1 is promoted to int when 1 is added and must be cast back to char.
- What is the value of
`(let1 - 'A' + 1)`?
- char has no operators so both arguments of - are promoted to int.
